Mobile Sales and Trends Analysis

Business Problem

A major mobile phone retailer operating across India, Turkey, Bangladesh, and Pakistan had not centralised view of its sales performance. Revenue data, product mix, customer demographics, and channel performance all existed in raw form with no structure to support analysis or decision-making.

The business could not identify which brands, markets, or channels were driving growth, how selling prices were trending, or how performance was changing month over month. Decisions were made on intuition rather than data, creating direct exposure to revenue loss through delayed action.

Analytical Framework

A structured analytics solution was built using the SCAN Framework. The business problem was scoped, a metric hierarchy was defined with Total Revenue as the North Star, and a Power BI report was built on a normalised star schema data model.

The report delivers six focused pages covering the North Star, the three Catalysts (Average Selling Price, Total Units Sold, Total Transactions), and diagnostic breakdowns by product, geography, customer, and channel. Every visual traces back to the North Star.

Headline Results

Total Revenue	Total Units Sold	Avg Selling Price	Top Market
14,525,413	**18,548**	**784.73**	**India**
Full year 2024	*Across 4 markets*	*Per device*	*6.97M revenue*

Key Results

Revenue Performance

Revenue peaked in January at 1.41M and troughed in September at 988K, the only month below 1M. Transaction counts stayed consistent at 29 to 31 per month, confirming that revenue variation was driven by product mix and pricing rather than customer activity.

Brand and Product

Apple leads with 3.64M, followed by Samsung (3.48M), OnePlus (3.03M), Google (2.55M), and Xiaomi (1.82M). Android accounts for 74.9% of revenue vs iOS at 25.1%. Brand preference varies by market: Samsung dominates India, OnePlus leads Turkey, Apple tops Bangladesh, and Xiaomi leads Pakistan.

Customer Profile

Female customers account for 49.6% of revenue. Spending increases with age: the 18 to 29 group averages 787 per device, rising to 831 for the 54 to 65 group. Older customers strongly prefer Apple, while younger customers favour OnePlus and Xiaomi, reflecting a clear relationship between age and willingness to pay a premium.

Channel and Payment

Online is the dominant channel at 62.3% of revenue across 213 transactions. Payment preferences are evenly distributed across EMI (26.8%), Credit Card (26.4%), Cash (25.1%), and UPI (21.7%).

All monetary values are presented in the dataset's native unit. Currency denomination is unspecified.

Recommendations and Business Impact · 2026

The following recommendations are drawn directly from the 2024 data. Each is paired with the specific business impact it addresses, quantified where the data supports it.

#	Recommendation	Business Impact
1	Prioritize India as the primary growth market. Increase stock depth and channel presence in key Indian cities, particularly Chennai and beyond.	✓ India generates 48% of total revenue (6.97M) and 46% of total units sold. ✓ A 10% increase in Indian market revenue alone would add approximately 697K to the top line, more than the entire Pakistan market.
2	Increase the availability and visibility of Apple and Samsung products across all markets.	✓ Apple and Samsung together generate 49% of total revenue despite representing just 2 of 5 brands. ✓ They also have the highest average selling prices, meaning a shift in brand mix toward these two brands lifts the North Star without requiring additional transactions.
3	Launch a targeted promotional campaign ahead of and during September to address the annual mid-year revenue dip.	✓ September is the only month in 2024 that fell below the 1M revenue threshold, recording 988K. ✓ A modest 5% revenue uplift in September alone would recover approximately 50K and restore all 12 months above the threshold.
4	Conduct a strategic review of the Pakistan market, focusing on product range realignment and pricing optimization.	✓ Pakistan records an average selling price of 619, which is 27% below the overall average of 784. ✓ Aligning Pakistan's product mix and pricing closer to Bangladesh's profile (average 736) could increase Pakistan's revenue contribution by an estimated 65% without requiring a larger customer base.
5	Continue investing in and expanding the Online channel as the primary revenue driver.	✓ Online generates 62.3% of total revenue and the highest average units per transaction at 52.7, compared to 43.5 for the Partner channel. ✓ Shifting 10 Partner transactions to Online would generate an estimated 930 additional units, based on the differential in average transaction size.
6	Develop targeted marketing and product strategies for the 54 to 65 age segments, particularly around Apple products.	✓ The 54 to 65 age group records the highest average spend at 831 per device and the strongest preference for Apple. ✓ This segment represents the highest value of customer cohort in the business. Increasing their transaction volume by 10% would generate approximately 309K in additional revenue based on current average spend.
